The Word Problem of a Group

- Consider a group G generated by a finite set Q
i. e. every element $g \in G$ can be written as $g = q_1^{\delta_1} \dots q_\ell^{\delta_\ell}$ with $q_i \in Q$, $\delta_i \in \{-1, 1\}$
- The word problem of G is the decision problem
 - Constant:** the group G generated by Q
 - Input:** a word $\mathbf{q} \in (Q^{\pm 1})^*$
 - Question:** is $\mathbf{q} = \mathbb{1}$ in G ?
- ...as a formal language: $WP_Q(G) = \{\mathbf{q} \in (Q^{\pm 1})^* \mid \mathbf{q} = \mathbb{1} \text{ in } G\}$

Fact (Anisimov 1971)

G is *finite* $\iff WP_Q(G)$ is *regular*

The Uniform Word Problem for Groups

But: We can also consider the group as part of the **input**!

Definition

The **uniform word problem** for groups is the decision problem

Input: a group G generated by Q and
a word $\mathbf{q} \in (Q^{\pm 1})^*$

Question: is $\mathbf{q} = \mathbb{1}$ in G ?

- **Problem:** How can we give a group as an **input** to an algorithm?
- **Typically:** using a finite presentation $G = \langle Q \mid r_1 = \mathbb{1}, \dots, r_k = \mathbb{1} \rangle$ "finitely presented"
- **Today:** We only consider finite groups! Possible: $Q = G$
- Possible descriptions: Cayley tables, Cayley graphs, matrices, permutations, ...

Some Known Results: Upper Bounds

Fact

The word problem for groups given as *Cayley tables*

Input: a *Cayley table* $G \times G \rightarrow G, (g, h) \mapsto gh$ of a finite group G and group elements $g_1, \dots, g_n \in G$

Question: is $g_1 \cdot \dots \cdot g_n = \mathbb{1}$?

is in LOGSPACE.

Theorem (Lipton, Zalcstein 1977/Simon 1979)

The word problem of a finitely generated *linear group*

Constant: $G \leq \text{GL}(d, \mathbb{F})$

Input: matrices $M_1, \dots, M_n \in G$

Question: is $M_1 \cdot \dots \cdot M_n$ the *identity matrix*?

is in LOGSPACE.

Some Known Results: Lower Bounds

Theorem (Cook, McKenzie 1987)

The problem

Input: *permutations π_1, \dots, π_ℓ in cycle notation*

Output: *the product $\pi_1 \dots \pi_\ell$ in cycle notation*

is complete for functional LOGSPACE.

Theorem (Barrington 1986)

The word problem $WP(A_5)$ of the group of even permutations over $\{a_1, \dots, a_5\}$ is NC^1 -complete.

Boolean circuits, bounded fan-in, $\mathcal{O}(\log n)$ depth;
 $NC^1 \subseteq LOGSPACE$

In fact: this holds for any non-solvable finite group!

This yields: The uniform word problem for any group presentation (allowing A_5) is NC^1 -hard!

Presenting Groups Using Automata

Automata

- In this setting, a \mathcal{G} -automaton is a

- finite-state,
- letter-to-letter

transducer

- without final or initial states

which is

- complete,
- deterministic and
- invertible.

Example 0/0

1/0 1/1

State Actions

- Idea: every state q induces a bijection $\Sigma^* \rightarrow \Sigma^*$ mapping input to output words

Example

- p induces the identity function

- | | | | |
|--------------|--------------|--------------|---------------------|
| 0 | 0 | 0 | $q \circ 000 = 100$ |
| \downarrow | \downarrow | \downarrow | |
| q | p | p | $q \circ 100 = 010$ |
| \downarrow | \downarrow | \downarrow | |
| 1 | 0 | 0 | $q \circ 010 = 110$ |
| \downarrow | \downarrow | \downarrow | |
| q | q | p | |
| \downarrow | \downarrow | \downarrow | |
| 0 | 1 | 0 | |

$\rightsquigarrow q$ increments (reverse) binary representation
(least significant bit first)

Automaton Groups

- A \mathcal{G} -automaton \mathcal{T} with state set Q generates a group $\mathcal{G}(\mathcal{T})$:

it is the closure under composition of the bijections induced by the states and their inverses.

Such a group is an automaton group.

Example

- p : identity
- q : increment, q^{-1} : decrement
- $qp = pq = q$ in $\mathcal{G}(\mathcal{T})$
- $qq \circ 000 = q \circ 100 = 010$
- q^n : "add n ", q^{-n} : "subtract n "

$$\mathcal{G}(\mathcal{T}) = F(q) \simeq \mathbb{Z}$$

Finitary Automaton Groups as Finite Groups

A finitary automaton has no cycles except for self-loops at the identity state
 \rightsquigarrow it is a labeled directed acyclic graph

Example

Effectively all functions
 are $\Sigma^d \rightarrow \Sigma^d$
 \rightsquigarrow all finitary automaton
 groups are finite

Finite Groups as Finitary Automaton Groups

An arbitrary finite group $G = \{\text{id}, g_1, \dots, g_n\}$ is generated by the finitary \mathcal{G} -automaton

Fact

G is finite $\iff G$ is a finitary automaton group

Why Automata?

Because: the presentation using automata is powerful

- General case: Many groups with interesting properties are automaton groups
For Example: Grigorchuk's group, which is not finitely presented.
 \rightsquigarrow finite automata can encode groups without traditional finite presentations
- For finite groups: We can achieve a doubly exponential compression
For Example:

Automorphism group of
the regular binary tree
of depth n

$$|\mathcal{T}| = n + 1$$

$$\mathcal{G}(\mathcal{T}) = \text{Aut } B_n$$

$$\implies |\mathcal{G}(\mathcal{T})| = 2^{2^n - 1}$$

The Uniform Word Problem for Finitary Automaton Groups

Theorem (Kotowsky, W.)

The uniform word problem for finitary automaton groups

Input: a finitary \mathcal{G} -automaton $\mathcal{T} = (Q, \Sigma, \delta)$ \dots it is PSpace-complete for general automaton groups
 $\mathbf{q} \in (Q^{\pm 1})^*$

Question: is $\mathbf{q} \circ u = u$ for all $u \in \Sigma^*$ (i. e. $\mathbf{q} = \mathbb{1}$ in $\mathcal{G}(\mathcal{T})$)?

W., Weiß (2020)

is coNP-complete.

Proof (complement is in NP).

- For the depth $d < |Q|$, we have:

$$\mathbf{q} \begin{array}{c} \dashrightarrow \\ \uparrow \\ u \\ \downarrow \\ v \end{array} \text{id}^{|\mathbf{q}|} \quad \text{for all } u \in \Sigma^{\geq d}.$$

- $\mathbf{q} \neq \mathbb{1}$ in $\mathcal{G}(\mathcal{T}) \implies \exists u \in \Sigma^d : \mathbf{q} \circ u \neq u$
- Algorithm: "guess & check"
 - Guess witness u with $|u| < |Q|$ (in time $|Q|$).
 - Check $\mathbf{q} \circ u \neq u$ (in time $\approx |Q| \cdot |\mathbf{q}|$).

Barrington's Idea (1986)

A_5 : Group of even permutations over $\{a_1, \dots, a_5\}$

Fact

$$\sigma^\alpha = \alpha^{-1} \sigma \alpha$$

There are $\sigma, \alpha, \beta \in A_5$ with $\sigma \neq \text{id}$ and $\sigma = [\sigma^\beta, \sigma^\alpha]$.

$$[h, g] = h^{-1} g^{-1} h g$$

Definition (Balanced Commutator)

$$B[\mathbf{q}_1] = \mathbf{q}_1$$

$$B[\mathbf{q}_t, \dots, \mathbf{q}_1] = \left[B[\mathbf{q}_t, \dots, \mathbf{q}_{\lfloor \frac{t}{2} \rfloor + 1}]^\beta, B[\mathbf{q}_{\lfloor \frac{t}{2} \rfloor}, \dots, \mathbf{q}_1]^\alpha \right]$$

It's a logical conjunction!

Proposition

$$g_1, \dots, g_t \in \{\sigma, \text{id}\}$$

$$B[g_t, \dots, g_1] = \begin{cases} \sigma & \forall i: g_i = \sigma \\ \text{id} & \text{otherwise} \end{cases}$$

Proposition

$B[\mathbf{q}_t, \dots, \mathbf{q}_1]$ can be computed in LOGSPACE.

Proof (complement is NP-hard)

- We reduce 3SAT

Input: boolean formula $\varphi = \bigwedge_{k=1}^K C_k$ with
 $C_k = (\neg)X_{n_{k,3}} \vee (\neg)X_{n_{k,2}} \vee (\neg)X_{n_{k,1}}$ over variables $\mathbb{X} = \{X_1, \dots, X_N\}$

Question: $\exists \mathcal{A} : \mathbb{X} \rightarrow \mathbb{B} : \mathcal{A} \models \varphi?$

to the complement of the word problem.

- We need a map $\varphi \mapsto (\mathcal{T}, \mathbf{q})$ in logarithmic space s. t. φ is satisfiable $\iff \mathbf{q} \neq \perp$ in $\mathcal{G}(\mathcal{T})$
- alphabet: $\Sigma = \{a_1, \dots, a_5\} \ni \perp, \top$ $\langle \mathcal{A} \rangle \in \{\perp, \top\}^N$: encoding of \mathcal{A}
- technical states:

- same for β

Proof (continued)

- Important part: Example: $C_k = X_{n_3} \vee \neg X_{n_2} \vee X_{n_1}$ (w.l.o.g.: $n_3 < n_2 < n_1$)

missing transition go to id with b/b

- Invariant for $w \in \Sigma^N$: $c_k = c_{k,N} \begin{array}{c} \xrightarrow{w} \\ \perp \\ \xrightarrow{w} \end{array} \begin{cases} \sigma_0 & \text{if } w = \langle \mathcal{A} \rangle, \mathcal{A} \models C_k \\ \text{id} & \text{otherwise} \end{cases}$

Proof (continued further)

Invariant for $w \in \Sigma^N$:

$$c_k \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} \begin{cases} \sigma_0 & \text{if } w = \langle \mathcal{A} \rangle, \mathcal{A} \models C_k \\ \text{id} & \text{otherwise} \end{cases}$$

Goal:

φ is satisfiable $\iff \mathbf{q} \neq \mathbf{1}$ in $\mathcal{G}(\mathcal{T})$

Set $\mathbf{q} = B_N[c_K, \dots, c_1]$

Convention: B_n uses α_n and β_n

instead of α and β

Let $w \in \Sigma^N$.

$$\begin{array}{ccc} & w & \\ c_1 & \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} & \sigma_0 \text{ or id} \\ & w & \\ \vdots & \vdots & \vdots \\ & w & \\ c_k & \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} & \sigma_0 \text{ or id} \\ & w & \\ \vdots & \vdots & \vdots \\ & w & \\ B_N[c_K & \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} & \sigma_0 \text{ or id} \\ & w & B_0 \end{array}$$

Proof (continued further)

Invariant for $w \in \Sigma^N$:

$$c_k \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} \begin{cases} \sigma_0 & \text{if } w = \langle \mathcal{A} \rangle, \mathcal{A} \models C_k \\ \text{id} & \text{otherwise} \end{cases}$$

Goal:

φ is satisfiable $\iff \mathbf{q} \neq \mathbb{1}$ in $\mathcal{G}(\mathcal{T})$

Set $\mathbf{q} = B_N[c_K, \dots, c_1] \neq \mathbb{1}$ in $\mathcal{G}(\mathcal{T})$

Convention: B_n uses α_n and β_n

instead of α and β

Let $w = \langle \mathcal{A} \rangle$ for $\mathcal{A} \models \varphi$.

$$\left. \begin{array}{c} w \\ c_1 \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \sigma_0 \text{ or id} \\ \vdots \\ w \\ c_k \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \sigma_0 \text{ or id} \\ \vdots \\ w \\ c_K \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \sigma_0 \text{ or id} \\ B_N[\quad] \\ w \\ B_0[\quad] \end{array} \right\} = \sigma_0 \begin{array}{c} \xrightarrow{a_1} \\ \downarrow \\ \xrightarrow{\neq a_1} \end{array} \text{id}$$

Proof (continued further)

Invariant for $w \in \Sigma^N$:

$$c_k \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} \begin{cases} \sigma_0 & \text{if } w = \langle \mathcal{A} \rangle, \mathcal{A} \models C_k \\ \text{id} & \text{otherwise} \end{cases}$$

Goal:

φ is satisfiable $\iff \mathbf{q} \neq \mathbf{1}$ in $\mathcal{G}(\mathcal{T})$

Set $\mathbf{q} = B_N[c_K, \dots, c_1]$

Convention: B_n uses α_n and β_n
instead of α and β

Let $w = \langle \mathcal{A} \rangle$ for $\mathcal{A} \not\models \varphi$.

$$\left. \begin{array}{c} \begin{array}{c} w \\ \downarrow \\ c_1 \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \\ \vdots \\ \begin{array}{c} w \\ \downarrow \\ c_k \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \\ \vdots \\ \begin{array}{c} w \\ \downarrow \\ c_K \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \end{array} \right\} = \text{id} \begin{array}{c} \xrightarrow{u} \\ \downarrow \\ \xrightarrow{u} \end{array} \text{id}$$

B_N [B_0]

Proof (continued further)

Invariant for $w \in \Sigma^N$:

$$c_k \begin{array}{c} \xrightarrow{w} \\ \downarrow \\ \xrightarrow{w} \end{array} \begin{cases} \sigma_0 & \text{if } w = \langle \mathcal{A} \rangle, \mathcal{A} \models C_k \\ \text{id} & \text{otherwise} \end{cases}$$

Goal:

φ is satisfiable $\iff \mathbf{q} \neq \mathbf{1}$ in $\mathcal{G}(\mathcal{T})$

Set $\mathbf{q} = B_N[c_K, \dots, c_1]$

Convention: B_n uses α_n and β_n
instead of α and β

Let $w \notin \{\perp, \top\}^N$.

$$\left. \begin{array}{c} \begin{array}{c} w \\ \downarrow \\ c_1 \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \\ \vdots \\ \begin{array}{c} w \\ \downarrow \\ c_k \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \\ \vdots \\ \begin{array}{c} w \\ \downarrow \\ c_K \end{array} \begin{array}{c} \xrightarrow{\quad} \\ \downarrow \\ \xrightarrow{\quad} \end{array} \begin{array}{c} \sigma_0 \text{ or } \text{id} \\ \vdots \\ \vdots \end{array} \end{array} \right\} = \text{id} \begin{array}{c} \xrightarrow{u} \\ \downarrow \\ \xrightarrow{u} \end{array} \text{id}$$

B_N [B_0]

The Uniform Compressed Word Problem for Finitary Automaton Groups

Theorem (Kotowsky, W.)

The uniform compressed word problem for finitary automaton groups

Input: a finitary \mathcal{G} -automaton $\mathcal{T} = (Q, \Sigma, \delta)$
 a straight-line program encoding $\mathbf{q} \in (Q^{\pm 1})^*$

Question: is $\mathbf{q} = \mathbb{1}$ in $\mathcal{G}(\mathcal{T})$?

is PSPACE-complete.

*a context-free grammar
generating a single word*

*...it is ExpSpace-complete for
general automaton groups
W., Weiß (2020)*

- We prove this using a similar reduction from QBF.
- **However:** One may also finitely approximate various other groups with PSPACE-complete compressed word problem
Bartholdi, Figelius, Lohrey, Weiß (2020)

Thank you!
